The blockchain for the crypto-ecommerce economy

What is eComX?

eComX.org is an active blockchain project entering its 2nd stage of development and managed by eComX Corporation, a United States Company. During Stage 1 of the project, eComX completed and aggressive set milestones including the release of its "Dapp Store" and of its crypto-ecommerce marketplace www.eComX.world.

For the 2nd stage of its development roadmap, eComX has a list of advanced blockchain innovations for the crypto-ecommerce economy, such as: 1. eComX Blockchain with built-in support for the Dandelion (de)anonymization protocol, for added protection to users' private information. 2. eComX Asset Dataset Wrapping and Transport token technology to solve the interoperability problem between centralized asset datasets and the blockchain. 3. A Parallel Listening and Firing Event Mechanism to allow multiple events to be combined into complete transactions (purchase, logistic, shipping, customs,…,etc.) then packaged into blocks for optimum parallel computing processing. 4. A new generation of Hybrid Consensus Algorithms for maximum parallel transaction processing throughput. 5. eComX Optimized Turin-Complete VM, and 6. eComX Software Production and Testing Sandbox to enable our partners to quickly create, test, and deploy smart contracts and services based on the eComX Protocol.

Problems we are solving

Inter-operability between centralized assets and the blockchain. Inter-operability between other blockchains and eComX. Under development

Scalability and speed of transaction processing using a new generation of consensus and reward system. Under development

Protection to users' private information

A "Dapp Store" where eComX and its partners can feature new Dapps and Services related to ecommerce and make available to the crypto-community. Available at
www.eComX.org/DappStore

A cross border marketplace where sellers and buyers can conduct transactions in fiat or crypto currencies. Available at www.eComx.world and at the eComX Dapp Store.
